Declaration

I hereby declare that the project work entitled "**Skin Care Product and Services**" submitted to Institute of Science and Technology, Tribhuvan University, Kathmandu. **National College of Computer Studies**, Kathmandu, is for the degree is submitted in partial fulfillment of requirements for the degree of Bachelor of Science in Computer Science and Information Technology (B.Sc.CSIT). This report contains all the original research and analysis with some information taken from other resources which are properly cited. This project work has not been submitted to any other university or institution for the award of any degree or diploma.

Acknowledgement

This report is my assignment as a partial fulfillment of project work course for the requirement of Bachelor of Science in Computer Science and Information Technology (B.Sc.CSIT). I have taken this opportunity to express my respect and gratitude to my respected teacher **Mr. Yachu Shakya** for his valuable guidance in making this project a reality. I am thankful for his constant support and encouragement and valuable guidance and encouragement throughout this project completion period. I would like to present my teachers gratitude for their guidance, good advices and honest reviews in this entire project session. Project has been completed under the intensive and genuine guidance of National College of Computer Studies.

Abstract

This project is a dynamic web-based skincare platform designed to offer users a personalized and informative skincare experience. It integrates e-commerce functionality, a skin-type detection quiz, expert consultation booking, and educational blog content into a single, user-friendly interface.

Users can register and log in to access features such as a skin-type quiz, personalized product recommendations, product purchases, and dermatologist appointment booking. The platform enhances shopping efficiency through a smart filtering system that allows users to browse products based on specific skin types and categories such as cleansers, moisturizers, and sunscreens. Additionally, users can read skincare blogs and reels for self-education and wellness improvement.

An administrative panel is provided for backend management, enabling the admin to handle user accounts, products, blog posts, orders, doctor profiles, and appointment bookings. The platform is developed using HTML, CSS, JavaScript, PHP, and MySQL, ensuring a responsive design, secure data handling, and real-time interactivity.

1.Introduction

In recent years, the skincare industry has experienced rapid growth with increasing consumer awareness about personalized skincare needs. However, choosing the right product can be overwhelming due to the variety of skin types and concerns. This project aims to bridge the gap between users and suitable skincare solutions by offering a web-based platform that provides personalized skincare routines based on skin type, an e-commerce shop to buy recommended products, dermatologist appointment booking, and educational content through blogs and reels. The platform ensures a seamless user experience while empowering users to make informed skincare decisions.

2. Objectives

- To develop a web application that provides a personalized skincare routine based on a user's skin type.
- To enable users to search, filter, and purchase skincare products through an e-commerce module.
- To allow users to book dermatologist consultations online.
- To provide educational skincare content through blogs and reels.
- To build an admin dashboard to manage users, products, blogs, orders, bookings, and doctors.
- To ensure data is securely stored

3. Problem Definition and Analysis

Problem:

Many individuals face difficulties when it comes to identifying their unique skin type and selecting the appropriate skincare products that suit their specific needs. This challenge is further amplified by the overwhelming number of products available in the market, each claiming different benefits. A significant number of e-commerce skincare platforms do not offer personalized support or access to professional guidance, which often results in users adopting ineffective skincare routines. Consequently, customers experience disappointment, waste money on unsuitable products, and struggle to achieve desired results.[1]

Analysis:

- Users often rely on trial and error to choose products.
- There is a lack of consolidated platforms offering both skincare products and expert guidance.
- Existing platforms rarely personalize the shopping experience based on user needs.
- There is a demand for platforms offering education, consultation, and shopping under one ecosystem.

This project addresses these issues by creating a centralized, intelligent, and interactive skincare platform.

4. Technical Details

The skincare platform is built using a combination of web development technologies aimed at creating a responsive, dynamic, and user-friendly interface, alongside a robust backend system for processing and data management.[2]

Frontend:

- **HTML**: Used for structuring the content and layout of the platform, ensuring semantic and accessible design.
- **CSS**: Applied for styling and layout customization to deliver an aesthetically pleasing and mobile-responsive interface.
- **JavaScript**: Utilized for adding client-side interactivity, such as dynamic filtering of products, form validation, skin-type quizzes, and other responsive features that enhance user experience.

Backend:

- **PHP**: Powers the server-side logic, handling form submissions, user authentication, session management, and interaction with the database. It also facilitates personalization features based on user profiles.
- **Session Handling**: Enables persistent user login, secure access control, and tailored recommendations by maintaining user session data.

Database:

- **MySQL**: Used for storing user data, product information, skin-type results, and consultation history in a structured format. It allows for efficient data querying and management.[1]

Development Environment & Server:

- **XAMPP**: A local development environment that integrates Apache server, MySQL database, and PHP processing. It enables efficient local testing and debugging before deployment.
- **Apache Server**: Hosts the application and processes PHP scripts, delivering dynamic content to users.

5. Features

User-Side Features:

- **User Registration and Login System**
  Secure sign-up and login system that allows users to create personal accounts, store preferences, and access customized features. Sessions are managed to maintain a personalized experience.
- **Skin-Type Detection Quiz**
  An interactive questionnaire designed to identify the user's skin type based on their inputs (e.g., oiliness, sensitivity, hydration levels). Upon completion, the system provides personalized product recommendations tailored to their unique skin needs.
- **Filterable Product Browsing**
  Users can easily browse products filtered by skin type (e.g., oily, dry, sensitive, combination), product category (e.g., cleanser, moisturizer, serum).
- **Add to Cart and Checkout**
  Smooth and secure shopping experience that allows users to add products to their cart, complete purchases through a simplified checkout process.[4]
- **Online Dermatologist Appointment Booking**
  Integrated scheduling system for users to book virtual consultations with certified dermatologists, helping them receive expert guidance directly from the platform.
- **Blog/Reels Section for Skincare Education**
  A dedicated section featuring expert-written blogs, skincare routines, and tips to help users understand and improve their skincare journey.[3]
- **User Dashboard**
  A personalized dashboard where users can:
  - View their skin type and quiz history
  - Receive tailored content and product suggestions

Admin-Side Features:

- **Admin Login and Secure Access**
- **Product Management**
  Admins can:
  - Add new skincare products with descriptions, images, prices, and skin-type
  - Edit existing product details
  - Delete outdated or discontinued products
- **User and Booking Management**
  Admins can monitor user activity, update user details, and manage dermatology appointment bookings, ensuring smooth user support and experience.
- **Order Management**
  A centralized interface to view, track, and update customer orders. Admins can process, fulfill, or cancel orders as necessary.
- **Blog Management**
  Ability to create, edit, and delete skincare blogs,
- **Doctor Profile and Schedule Management**
  Admins can onboard new dermatologists, update their profiles

7. Future Enhancements

To ensure continuous growth, enhanced user experience, and broader functionality, the following features are planned for future implementation:

- **Integration of Secure Online Payment Gateways**
  Incorporating trusted and secure payment solutions such as Esewa, khalti to enable seamless online transactions.[2] This will improve the checkout process and support a wider range of payment methods.
- **OTP or Email Verification During Registration**
  Adding multi-step authentication via One-Time Password (OTP) or email verification to strengthen account security, prevent spam sign-ups, and ensure valid user registrations.
- **Automated Email or SMS Confirmations**
  Implementing automated notifications to confirm appointment bookings, order status updates, and other critical user actions via email and/or SMS, enhancing communication and trust.[1]
- **Product Review and Star Rating System**
  Enabling users to leave feedback on purchased products, rate them with stars, and share personal experiences. [3] This not only builds community trust but also helps others make informed decisions.
- **Doctor-Side Login and Dashboard**
  Creating a dedicated portal for dermatologists to log in, manage their profiles, view and respond to user bookings, update availability, and maintain patient interaction logs.
- **AI-Based Skincare Recommendations via Face Analysis**
  Integrating advanced AI and computer vision technology to analyze user-submitted facial images. This feature would provide hyper-personalized skincare suggestions based on visible concerns such as acne, pigmentation, dryness, or oiliness.
- **Push Notifications for Offers and Tips**
  Allowing users to opt-in for push notifications (via web or mobile) to receive real-time updates about promotional offers, seasonal skincare routines, product restocks, or expert advice.[5]

8. Conclusion

This project successfully delivers a unified skincare platform that combines personalization, e-commerce, education, and expert guidance. By allowing users to understand their skin type, access targeted product recommendations, and consult dermatologists online, the platform addresses major pain points in the skincare journey. [5]The admin panel ensures smooth backend management, making it easy to maintain and scale the system. Built with commonly used web technologies, this project is scalable, practical, and highly applicable in today's growing personal care industry.[4]
